## Enterprise Information Portal

At the core of the mymicros.net solution is the Enterprise Information Portal (EIP). It is an elegant yet very powerful data warehouse that is easily mined with a simple web browser. It includes a POS independent Internet agent that collects information from stores or outlets in near real-time. The solution requires very little end-user administration. Once implemented, it quickly presents a valuable view of your business.

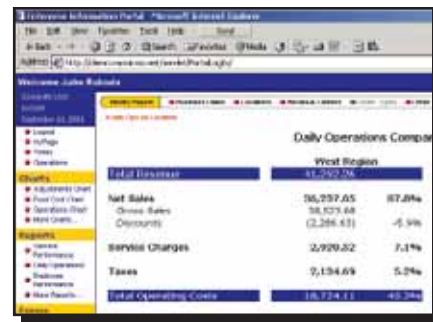

**The key to its power lies in its communications, consolidation, warehouse, and Business Intelligence capabilities.**

- **Communications**—Many foodservice operators transport data to and from their stores with proprietary third party software such as PC Anywhere and dialup communications. Mymicros.net includes an Internet friendly solution that transports information securely, frugally and resiliently across all of today's IP networks including dial-up, frame, ISDN DSL, satellite and cable. It may be remotely installed which means that installations are fast and easy. Best of all, it can be controlled and managed from a web browser saving valuable time.
- **Consolidation**—mymicros.net is designed from the ground up for the Enterprise. It collects financial, labor, CRM and transaction level detail from your POS system or other data sources as often as every 15 minutes. The transaction information is loaded automatically into the potent data warehouse. No more manual spreadsheet acrobatics -- company, region, area and district report consolidations and comparisons are available immediately. It handles the problem of disparate POS databases and out of synch menus elegantly through its unique Alignment process.

Differently named and numbered items may be aligned quickly and easily to provide insightful enterprise views.

- **Data Warehouse**—mymicros.net includes a second-generation data warehouse, designed specifically for food service, not for the insurance, manufacturing or some other unrelated industry. It incorporates suggestions and feedback from literally hundreds of customers around the globe.
- **Business Intelligence**—Business Intelligence is the key to mymicros.net's success. It's really easy to use. No more confusing options and selections to get to the right information. It includes a financial calendar to quickly select your periods, an organizational structure to select stores, and many other valuable components that allow you to get information quickly. There are many other invaluable features such as drill downs to bottom out issues. The iQuery plug-in allows the more demanding managers to create their own reports in a familiar Excel environment. Report Mail may be used to automatically email staff information daily or hourly. Finally the Audit & Analysis component included in mymicros.net allows you to quickly identify exceptions.

Simply put, the Enterprise Information Portal of mymicros.net provides a simple, powerful, and single point of integration for management to easily access operational and financial information.

Comparative analysis is quick and easy for single or multiple locations.
